

Adaptation effects depend on the training recipe

a Code · one pass

b Math · one pass

c Code · quarter x4

d Math · quarter x4

All 48 strict-backend adaptation effects; positive values mean less forgetting than the same-recipe zero-inner control. Boxes: both learning and retention point estimates improve; not a significance test. Colors saturate at ± 0.015 . 512 documents/domain; one training seed; examined holdouts. These gains do not establish superiority to ordinary AdamW. Legacy-backend anchors are included in the companion all96 plot and can reverse the code effect.
