All 16 selected trajectories and five fixed points each: base, quarter, half, three-quarter and final. Lines only guide the eye. AdamW 1e-5 at half horizon learns more and forgets less than all six adapted SGD terminals in these measured comparisons. For inner 3e-5: ordinary minus adapted Δ target/FineWeb = $-0.00670/-0.00540$ (code), $-0.00342/-0.01832$ (math). One training seed; previously examined documents; curve selection followed the 96-terminal study. No independent confirmation claim.
